

B=8 batched (lr=1e-3, token-mean): magnitude ✓, sign ✗

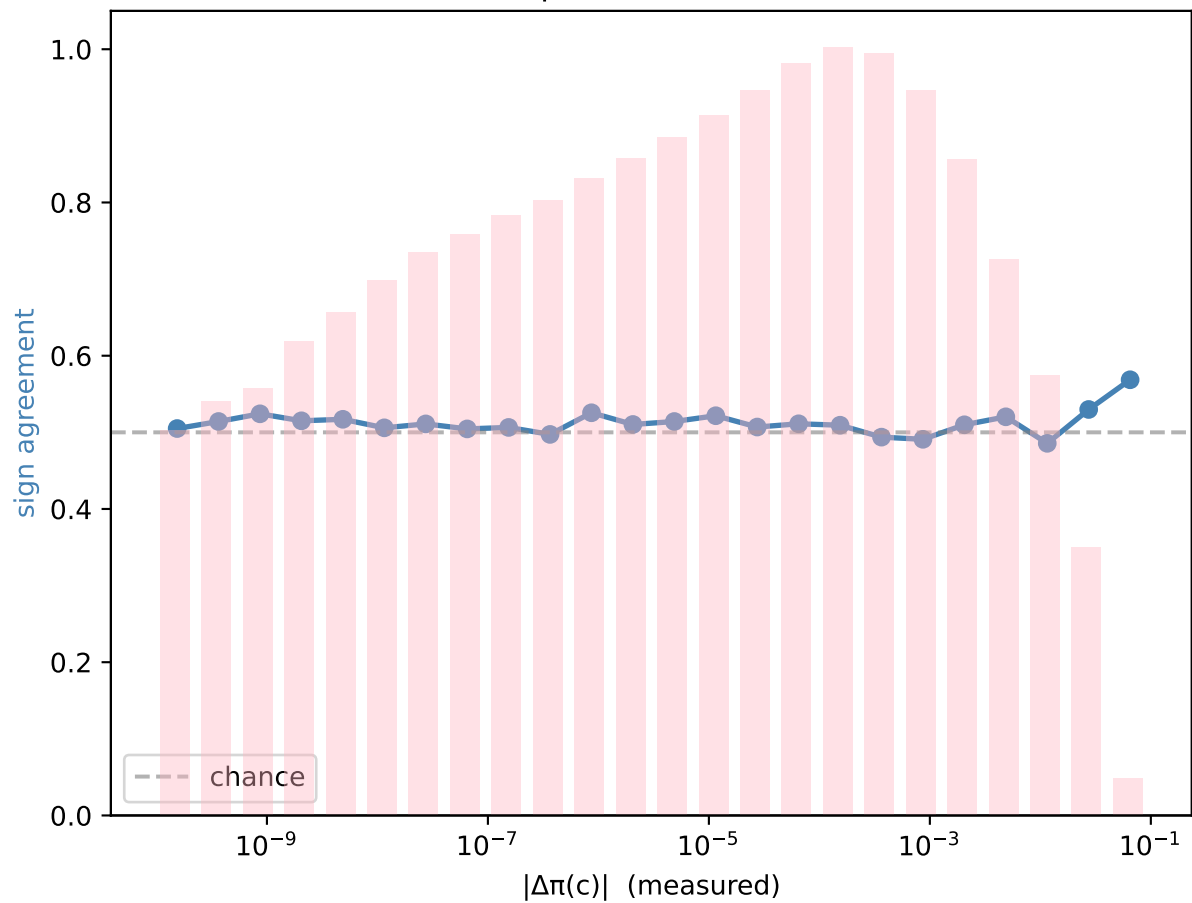

Magnitude correlation (non-sampled c)
Spearman = 0.819, log-Pearson = 0.801

Binned: $|\Delta\pi|$ tracks predicted magnitude
(within a constant factor $\rightarrow$ theory captures relative size)

Sign rule fails uniformly across $|\Delta\pi|$ scale
(no quantile rescues it)

Sign rule fails uniformly across $|A|$
(strong A does not help)
